STEM Pedagogical Content Knowledge (STEMPCK) Scale: A Validity and Reliability Study

Bekir Yıldırım and Emine Şahin Topalçengiz
Muş Alparslan University, Turkey

ABSTRACT

The aim of this study was to develop the STEM Pedagogical Content Knowledge Scale (STEMPCK Scale). Exploratory and confirmatory factor analyses were conducted to examine the structural validity of the scale. Exploratory factor analysis of the scale was conducted using data from 443 preservice teachers who were studying to become science teachers, preschool teachers, elementary school teachers, and mathematics teachers. The confirmatory factor analysis of the scale was conducted using data from 212 students who were enrolled in the same departments. The scale was administered to 655 preservice teachers in total. To determine the reliability of the scale, the Cronbach’s Alpha internal consistency coefficient, the corrected total item correlation, and the significance of the differences between the item averages of the top 27% and bottom 27% were examined by t-test. According to the results obtained, the STEMPCK Scale consists of six factors: 21st-Century Skills, Pedagogical Knowledge, Mathematics, Science, Engineering, and Technology. The scale included 56 items. The Cronbach’s Alpha values of the factors ranged from 0.878 to 0.90, and the corrected item total score correlations ranged from 0.306 to 0.895. The results of the t-test showed that all the differences between the mean scores of the top 27% and bottom 27% on the items were significant. The results of the analyses indicate that the instrument has reasonable internal consistency and that the theoretical structure was supported by empirical data. These results indicate that the STEMPCK Scale is an appropriate tool for measuring preservice teachers’ STEM pedagogical content knowledge. Implications and suggestions for further studies are included.

Keywords: Pedagogical content knowledge; Reliability; STEM; Validity

Scientific and technological progress requires workers to have different skills than in the past. In addition to foundational skills like literacy and numeracy, they need competencies such as problem solving, critical thinking, creativity, and collaboration and character qualities such as curiosity. To teach the skills that meet the needs of a 21st-century marketplace, countries have made reforms in their educational systems (Drew, 2011). Science, technology, engineering, and mathematics (STEM) lie at the heart of these reform movements. Through the integration of science, technology, engineering, and mathematics, students would be able to study the challenges that arise in today’s world such as energy shortages, environmental problems, and health problems (Bybee, 2010). Students fully equipped with STEM knowledge will be able to identify, apply, and integrate its concepts to understand complex problems and generate solutions to solve those
problems (Meng, Idris, Eu, & Daud, 2013). Successful integration of STEM largely “depends on whether teachers develop a solid understanding of subject matter and conceptualize connections among subjects” (Pang & Good, 2000, p. 77). Many teachers have holes in their subject content knowledge; therefore, asking teachers to teach another subject may create new knowledge gaps, challenges, and difficulties (Stinson, Harkness, Meyer, & Stallworth, 2009).

To successfully implement STEM education in schools, teachers should understand what STEM means and should be equipped with STEM-related skills and knowledge of STEM. Teachers should apply effective teaching methods and techniques in their classroom to support students’ learning of STEM areas (Lichtenberger & George-Jackson, 2013). Furthermore, teachers should acknowledge students’ success in STEM-related fields (Beier & Rittmayer, 2008). It is important for teachers to have strong content and pedagogical knowledge in STEM (Kennedy, Ahn, & Choi, 2008).

In the STEM education research literature, there is a no clear agreement about the concept of pedagogical content knowledge (PCK) and content knowledge for teaching. In spite of this lack of agreement, researchers use Shulman’s model as a basis for research about teachers’ PCK. According to Shulman (1986), several domains of knowledge influence how teachers teach. These domains are: content knowledge, general pedagogical knowledge (i.e., knowledge of strategies for classroom management), curriculum knowledge, PCK, knowledge of learners and their characteristics, knowledge of context (i.e., classroom), and knowledge the purposes and values of education (Cochran, DeRuiter, & King, 1993; Hume & Berry, 2011; Shulman, 1986). During the years, other researchers (Appleton, 2003; Cochran et al., 1993; Magnusson, Krajcik, & Borko, 1999) have built on or challenged Shulman’s approach by suggesting different views of PCK. From another point of view, PCK has its own unique identifiers (Magnusson et al., 1999). Based on these models, PCK is a transformation of knowledge from other knowledge categories (e.g., orientations toward science teaching, knowledge and beliefs about science curriculum, knowledge and beliefs about students’ understanding of specific science topics, knowledge and beliefs about assessment in science, and knowledge and beliefs about instructional strategies for teaching science; Magnusson et al., 1999).

Numerous methods of measuring teachers’ PCK have been developed since Shulman introduced it (Baxter & Lederman, 1999): the lesson planning method (developed by van der Valk and Broekman, 1999), the use of metaphors, the use of “classroom window” cases (developed by Loughran, Milroy, Berry, Gunstone, and Mulhall, 2001), expert–novice studies, interviews, classroom observations, and teacher focus groups (Abell, 2007; Baxter & Lederman, 1999; Hume & Berry, 2011; Loughran, Berry, & Mulhall, 2012). All these techniques are divided into three categories: (1) convergent and inferential techniques; (2) concept mapping, card sorts, and pictorial representations; and (3) multimethod evaluations (Baxter & Lederman, 1999).

In a review of research published in science education, different tools were used for gathering information about teacher practices, content knowledge, and PCK in STEM education interventions (Minner & Martinez, 2013; Minner, Martinez, & Freeman, 2013). These instruments are observation protocols such as the Instructional Strategies Classroom Observation Protocol (ISCOP), the Lesson Flow Classroom Observation Protocol (LFCPO), the Science Teacher Inquiry Rubric (STIR), Assessment of the Facilitation of Mathematizing (AFM), and Early Mathematics Classroom Observation (EMCO); scoring rubrics such as Transforming Instruction by Design in Earth Science (TIDES) and Scoop Notebook (Scoop); surveys such as the Indiana Mathematics Beliefs Scale (IMBS) and the Science Teaching Efficacy Belief Instrument (STEBI); protocols such
as Danielson’s Framework for Teaching Domains (FFT); and interviews such as Views of Nature of Science Form C (VNOS-C; Minner & Martinez, 2013; Minner et al., 2013). Most instruments have been developed to assess students’ knowledge and then adapted for teachers (Minner & Martinez, 2013). Furthermore, it seems that current instruments are limited to assessing teachers’ PCK in STEM (STEMPCK) and that more effort needs to be made to develop new instruments for STEM educational interventions (Benuzzi, 2015; Hudson, English, Dawes, King, & Baker, 2015; Rogers, Winship, & Sun, 2016; Stohlmann, Moore, & Roehrig, 2012). This study will hopefully begin to fill that gap by not only describing STEMPCK but also explaining how these areas will be assessed through one instrument.

To effectively integrate STEM education, teachers should adequately build STEMPCK. STEMPCK is a combination of different categories: STEM content knowledge, STEM integration knowledge, pedagogical knowledge, 21st-century skills knowledge, and context knowledge (Appleton, 1995, 2003; Avery, 2009; Ball, Thames, & Phelps, 2008; Benuzzi, 2015; Custer & Daughtery, 2009; Eckman, Williams, & Silver-Thorn, 2016; Eilks & Markic, 2011; Epstein & Miller, 2011; Harris & Hofer, 2011; Hill, Rowan, & Ball, 2005; Hudson et al., 2015; C. A. Lee & Houseal, 2003; K.-T. Lee & Nason, 2012; Nadelson, Seifert, Moll, & Coats, 2012; National Research Council, 2000; President’s Council of Advisors on Science and Technology [PCAST], 2010; Rogers et al., 2016; Stohlmann et al., 2012; Shulman, 1986; Wilson, 2011; Wang, Moore, Roehrig, & Park, 2011).

Content knowledge is defined as “the amount and organization of knowledge per se in the mind of the teacher” (Shulman, 1986, p. 9). This knowledge includes different components including knowledge of concepts (including principles and definitions), theories, ideas, organizational frameworks, knowledge of evidence and proof, and the knowledge construction process (Shulman, 1986). Teachers who have strong knowledge and skills in the STEM disciplines can easily integrate STEM education into practice and develop effective STEM teaching strategies (Abell, 2007; Ball et al., 2008; Bukova-Güzel, Cantürk-Günhan, Kula, Özgür, & Elçi, 2013; Nadelson et al., 2012; PCAST, 2010). Teachers’ effectiveness in teaching STEM subjects is related to their competence in the individual subjects (Eckman et al., 2016; C. A. Lee & Houseal, 2003). Teachers of STEM disciplines must have a conceptual understanding of how the STEM subjects are interactive and adaptable (Ostler, 2012). Besides having a broad knowledge base of STEM content, teachers must witness advanced integrated pedagogical models to be able to integrate these practices into their classroom teaching (Ostler, 2012). Furthermore, STEM integration knowledge is also related to STEMPCK and PCK. Teachers with strong STEMPCK do not avoid teaching STEM subjects and integrating STEM disciplines in the classroom (Yıldırım, 2016; Wang et al., 2011).

Pedagogical knowledge refers to knowledge of teaching methods, knowledge of classroom assessment, and knowledge of learning processes (Shulman, 1986). Teachers with deep pedagogical knowledge understand how students construct knowledge; understand cognitive, social, and developmental theories of learning; understand how such theories apply to students in their classroom; and are aware of what is going on in all parts of the classroom and are able to handle several classroom events. In short, pedagogical knowledge includes all issues related to student learning, classroom management, knowledge of assessments, knowledge of student characteristics, and lesson plan development and implementation (Yusof, Zakaria, & Maat, 2012; Briscoe & Peters, 1997; Shulman, 1986).
Twenty-first-century skills knowledge describes the skills and knowledge that all students must master to succeed in life and work. Twenty-first-century skills should be taught in conjunction with core academic knowledge (such as music, mathematics, and science) and other essential skills, such as learning and innovation skills (including critical thinking and problem solving, creativity and innovation, communication and collaboration, visual literacy, scientific and numerical literacy, cross-disciplinary thinking, and basic literacy); information, media, and technology skills (including information literacy; media literacy; and information, communications, and technology literacy); and life and career skills (including flexibility and adaptability, initiative and self-direction, social and cross-cultural skills, productivity and accountability, and leadership and responsibility; Binkley et al., 2012; Voogt & Roblin, 2010).

Context knowledge refers to knowledge of internal and external resources. Internal sources include reflection on personal experiences of teaching, and external sources include subject-matter knowledge and government rules about education and policies (Barnett & Hodson, 2001). Context defines the environment for teaching and learning that includes content. A classroom, the characteristics of the region, the culture of the school, students’ backgrounds, the province of the school, and the region of the school also affect the effectiveness and quality of STEM education (Harris & Hofer, 2011; Shulman, 1986; Yusof et al., 2012).

Up to this point, we have summarized the research on teachers’ PCK and proposed a new model, the STEMPCK model, to teach and train in-service and preservice teachers. Based on an intensive literature review and interviews with preservice teachers and engineering students, we hypothesized that STEMPCK has different categories: content knowledge, integration knowledge, pedagogical knowledge, 21st-century skills knowledge, and context knowledge. Although there have been many studies conducted to evaluate STEM teachers’ beliefs and to develop teachers’ experiences in the classroom while integrating STEM curricula, there is no single instrument to evaluate teachers’ STEMPCK. Because it is difficult and expensive to score open-ended questions, concept maps, and comments on videotaped lessons, there is a need for new instruments to evaluate teachers’ STEMPCK. Therefore, in this study, we developed a paper-and-pencil test: the STEM Pedagogical Content Knowledge Scale (STEMPCK Scale) for preservice teachers. We believe that this study makes an important contribution to research on STEMPCK.

Methods

In this study, an instrument, the STEMPCK Scale, was developed to determine preservice teachers’ STEMPCK.

Participants

The study was conducted during the fall semester of 2016 in a public university located in the eastern part of Turkey. The participants were preservice teachers from different departments, including Science Education, Mathematics Education, Early Childhood Education, and Elementary School Education.

Research Group

Two different groups of preservice teachers participated in this study. The first group consisted of 443 preservice teachers who were studying in the Science Education, Mathematics Education,
Early Childhood Education, and Elementary School Education departments. The second group consisted of 212 preservice teachers who were studying in the same departments. The exploratory factor analysis of the developed scale was conducted using data from the first group, and the confirmatory factor analysis was conducted using data from the second group. Because repeating the study and either redoing the exploratory factor analysis or conducting a confirmatory factor analysis after an exploratory factor analysis in the first sample or conducting two successive confirmatory factor analyses would not validate the supposed structure, different samples were used in the study. Frequency and percentage distributions of the preservice teachers in the first and second groups by their departments are shown in Table 1.

Table 1 shows that 11.29% of the participants in Study Group 1 were preservice science teachers, 18.06% were preservice mathematics teachers, 27.99% were preservice early childhood teachers, and 42.95% were preservice elementary school teachers. In Study Group 2, 16.51% of the participants were preservice science teachers, 19.81% were preservice mathematics teachers, 25.94% were preservice early childhood teachers, and 37.74% were preservice elementary school teachers. The distribution of preservice teachers by grade level is shown in Table 2. Table 2 shows that 33.74% of the preservice teachers were sophomore students, 35.73% were juniors, and 30.53% were seniors.

A sample consisting of 655 preservice teachers was selected for the exploratory and confirmatory factor analyses of the STEMPCK Scale. Exploratory and confirmatory factor analyses of the scale were performed using this sample. According to Comrey and Lee (1992), because this scale’s sample group is 655, it has a “very good” rating (p. 217). Additionally, Tavşancı (2002) also points out that to carry out factor analysis for a scale, the sample should be five to 10 times larger than the number of items. In this study, the sample is five times larger than the number of items.

**Development of the STEMPCK Scale**

In the process of developing an instrument to measure teachers’ STEMPCK, five stages were involved.
Stage 1. To develop the STEMPCK Scale’s items, interviews were conducted with 40 students from different education majors, including Science Education, Mathematics Education, Early Childhood Education, and Elementary School Education, and 17 students from the Computer Science department. In the interviews, students were asked open-ended questions regarding what they thought about content knowledge, STEM content knowledge, PCK, 21st-century skills, STEM integration knowledge, and STEM integration.

Stage 2. Before the scale was developed, an extensive review of the literature was conducted. This literature review included studies focused on the STEM disciplines; teaching the STEM disciplines; and scales to determine teachers’ PCK, technological PCK, and engineering PCK (e.g., Aksu, Metin, & Konyalıoğlu, 2014; Bukova-Güzel et al., 2013; Brenneman, 2011; Campbell, Abd-Hamid, & Chapman, 2010; Enochs, Smith, & Huinker, 2000; Faber et al., 2013; Halim, Mohd Meerah, Zakaria, Syed Abdullah, & Tambychik, 2012; Kelleys & Knowles, 2016; Kiray, 2016; Kloosterman & Stage, 1992; Koehler et al., 2011; Önal, 2016; Ryan, 2014; Schmidt et al., 2009; Unfried, Faber, Stanhope, & Wiebe, 2015; Viiri, 2003; Yıldırım & Selvi, 2015, Yusof et al., 2012).

Stage 3. The knowledge gained from the literature and the data gathered from interviews

DOI: https://doi.org/10.30707/JSTE53.2Yildirim
were used to develop a draft scale that included 72 items about STEMPCK. These items were placed under the themes: STEM content knowledge, STEM integration knowledge, pedagogical knowledge, 21st-century skills knowledge, and context knowledge.

Stage 4. Afterwards, to ensure content validity of the STEMPCK Scale, the draft scale was sent to six experts. Four of those experts were in the STEM field; one was in the Evaluation, Measurement, and Research Design department; and the last was an expert in PCK. The experts were asked to examine items regarding to their relevance to content coverage, understandability, and consistency among items. Experts’ suggestions about clarity of items were taken into consideration, and any necessary changes were made.

Stage 5. The final version of the 72-item draft scale was administered to 60 preservice teachers. Preservice teachers checked the comprehensibility of all developed items. Then, the items on the scale were rearranged based on statistical results. The last version, consisting of 56 items that were rated on a 5-point scale, was administered to 655 preservice teachers. Preservice teachers’ responses were analyzed using SPSS Statistics (Version 17) and LISREL (Version 8).

Factor Analysis of the STEMPCK Scale and Reliability Analyses

To conduct a descriptive factor analysis of the scale, the final draft of the STEMPCK instrument was administered to 433 preservice teachers. The confirmatory factor analysis of the scale was performed using data from 212 preservice teachers. The validity and reliability analyses of the scale were calculated using SPSS Statistics (Version 17) and LISREL (Version 8). The results of the exploratory and confirmatory factor analyses of the STEMPCK Scale are explained below.

Results of the exploratory factor analysis. Factor analysis is a collection of methods used to examine how underlying factors influence the variable (Büyüköztürk, 2006). There are two types of factor analyses: exploratory factor analysis and confirmatory factor analysis. Exploratory factor analysis attempts to investigate underlying factors, and confirmatory factor analysis tests how well the measured variables represent the number of constructs. Exploratory factor analysis was used in this study to determine the factoring situation of the items in the scale and their factor loads.

After conducting the exploratory factor analysis, the researchers performed a confirmatory factor analysis on the scale. The scale’s compliance with the factor analysis was assessed with the Kaiser-Meyer-Olkin (KMO) test and the Bartlett test. The KMO value of the 56-item scale was calculated as 0.88, and the Bartlett test was determined to be significant ($\chi^2 = 7722.135, df = 1540, p < .05$). The data were determined to be suitable for factor analysis because the KMO coefficient was bigger than 0.60 and because the Bartlett test was significant (Büyüköztürk, 2006).

Varimax analysis was applied to bring together factors with high correlations (Doğan, 2011). Based on the varimax analysis, three factors’ eigenvalues were found to be greater than 1. To calculate eigenvalue, a scree plot method was used. A scree plot shows the eigenvalues on the $y$-axis and the number of factors on the $x$-axis. Figure 1 shows the maximum number of factors. Additionally, after the sixth factor, the graph shows accelerated decline, meaning that seventh and eight factors’ variances were close to each other. This shows that the scale has a six-factor structure (Büyüköztürk, 2006).

As shown in Figure 1, the eigenvalues of the six factors on the scale (21st-Century Skills Knowledge, Pedagogical Knowledge, Mathematical Knowledge, Science Knowledge, Engineering Knowledge, and Technology Knowledge) were 14.928, 4.354, 3.065, 2.315, 2.267, and 2.00, respectively.
respectively. These values were above 1. However, the percentages of variance explained by the factors were 26.657%, 7.774%, 5.774%, 4.133%, 4.049%, and 3.571%, respectively.

**Reliability analysis.** The STEMPCK Scale’s internal consistency coefficient was calculated, and the Cronbach’s Alpha values are presented in Table 3. The Cronbach’s Alpha value was .95 for the entire STEMPCK Scale, .90 for the 21st-Century Skills Knowledge dimension, .87 for the Pedagogical Knowledge dimension, .85 for the Mathematical Knowledge dimension, .86 for the Science Knowledge dimension, .81 for the Engineering Knowledge dimension, and .78 for the Technology Knowledge dimension.

The variance quantities were ranked as follows: 21st-Century Skills Knowledge was 26.657%, Pedagogical Knowledge was 7.774%, Mathematical Knowledge was 5.774%, Science Knowledge was 4.133%, Engineering Knowledge was 4.049%, and Technology Knowledge was 3.571% (see Table 4). After factor rotation, the number of items for each factor was determined: 21st-Century Skills Knowledge included 15 items with factor loads ranging from 0.423 to 0.760, Pedagogical Knowledge consisted of 12 items with factor loads ranging from 0.434 to 0.724, Mathematical Knowledge consisted of eight items with factor loads ranging from 0.435 to 0.811, Science Knowledge consisted of eight items with factor loads ranging from 0.524 to 0.785, Engineering Knowledge consisted of seven items with factor loads ranging from 0.493 to 0.754, and Technology Knowledge consisted of seven items with factor loads ranging from 0.463 to 0.734.

The results indicate that the SPAB’s items corrected item-total correlation ranged from 0.306 to

PK3  | 3.85 | .861| .435                   | 1.371                        | .434                | .312               |

As shown in Table 5, the correlations between the 21st-Century Skills Knowledge and Pedagogical Knowledge factors ($r = .425$), the 21st-Century Skills Knowledge and Mathematical Knowledge factors ($r = .417$), the 21st-Century Skills Knowledge and Science Knowledge factors

0.895. $T$-tests comparing the total scores of the bottom 27% and top 27% for each item indicated that there was an important difference in scores for all items. The scores of the top 27% and bottom 27% of the total group tell us whether an item has discriminated the high scorers and low scorers on the scale.

Note. Factor load values lower than .30 are not shown in this table (Çokluk, Şekercioğlu, & Büyüköztürk, 2014).

The results of the *t*-value comparing the 27% of the students and the top and the 27% at the bottom shows that there is a significant difference in scores from all items (Wiersma & Jurs, 1990).
(\(r = .421\)), the 21st-Century Skills Knowledge and Engineering Knowledge factors (\(r = .261\)), and the 21st-Century Skills Knowledge and Technology Knowledge factors (\(r = .660\)) were statistically significant (\(p < .01\)). Moreover, the correlations between the Pedagogical Knowledge and Mathematical Knowledge factors (\(r = .389\)), the Pedagogical Knowledge and Science Knowledge factors (\(r = .361\)), the Pedagogical Knowledge and Engineering Knowledge factors (\(r = .508\)), and the Pedagogical Knowledge and Technology Knowledge factors (\(r = .427\)) were significant (\(p < .01\)). In addition, the correlations between the Mathematical Knowledge and Science Knowledge factors (\(r = .485\)), the Mathematical Knowledge and Engineering Knowledge factors (\(r = .323\)), and the Mathematical Knowledge and Technology Knowledge factors (\(r = .474\)) were significant (\(p < .01\)). Similarly, the correlations between the Science Knowledge and Engineering Knowledge factors (\(r = .330\)), and the Science Knowledge and Technology Knowledge factors (\(r = .507\)) were significant (\(p < .01\)). In brief, the correlations between the subdimensions of the STEMPCK Scale appeared to be significantly positive. The lowest correlation between the subdimensions of the STEMPCK Scale was 0.261, and the highest correlation was 0.660.

Results of the confirmatory factor analyses. As mentioned previously, exploratory factor analysis of the STEMPCK Scale was conducted with Study Group 1, and confirmatory factor analysis was conducted with Study Group 2. Study Group 2 consisted of 212 preservice teachers in the Mathematics Education, Science Education, Early Childhood Education, and Elementary School Education programs. A confirmatory factor analysis using the structural equation model was conducted to determine the existing structure of the scale (see Figure 2).

Model conformity of the STEMPCK Scale was tested by criteria such as the Goodness of Fit Index (GFI), the Adjusted Goodness of Fit Index (AGFI), the Root Mean Square Error of Approximation (RMSEA), the Comparative Fit Index (CFI), and the Normed Fit Index (NFI; Kılıç & Şen, 2014). Chi-square (\(\chi^2\)), \(\chi^2/SD\), RMSEA, RMR, GFI, and AGFI are commonly used in confirmatory factor analysis. In large samples, calculated \(\chi^2/df\) ratio can also be used as a criterion

** \(p < .01\).
Figure 2. Confirmatory factor analysis of the STEMPCK Scale.
for conformity adequacy. If calculated $\chi^2/df$ ratio is (1) $\chi^2 / df < 3$, it can be regarded as good fit; if it is up to (2) $\chi^2 / df < 5$, it can be regarded as sufficient.

If the GFI and AGFI values are higher than 0.90 (Hooper, Coughlan, & Mullen, 2008; Sümer, 2000) and the RMR and RMSEA values are lower than 0.05 (Jöreskog & Sörbom, 1993; Sümer, 2000), model–data fit is good. However, if the GFI value is higher than 0.85, the AGFI is higher than 0.80, and the RMR and RMSEA values are lower than 0.080, model–data fit is acceptable (Anderson & Gerbing, 1984; Hu & Bentler, 1999; Sümer, 2000). The results of the confirmatory factor analysis for the STEMPCK Scale are shown in Table 6.

According to the confirmatory factor analysis results, conformity between structural equation model and scale was high. Additionally, the Chi-square value was found to be significant. The value of $\chi^2$ depends on the size of the sample, and when the size of the sample increases, it provides significant results. Briefly, when the Chi-square value ($\chi^2$) is divided by the value of the degrees of freedom ($df$), it shows that the value is less than 3; in other words, based on the results, the model–data fit was high. In addition, if the CFI, NFI, and AGFI values are above 0.90, it indicates that the model–data fit is good. Also, if RMSEA value is 0.034, it indicates that the model–data fit is high. According to confirmatory factor analysis, it was determined that the STEMPCK Scale consists of six subdimensions and that model–data fit was high.

Discussion

The STEM disciplines (science, technology, engineering, and mathematics), Shulman’s model of PCK, and theoretical knowledge were used as a basis for the STEMPCK Scale, and items were written based on extensive review of the literature (e.g., Aksu et al., 2014; Bukova-Güzel et al., 2013; Brenneman, 2011; Campbell et al., 2010; Enochs et al., 2000; Faber et al., 2013; Kelleys & Knowles, 2016; Kiray, 2016; Kloosterman & Stage, 1992; Koehler et al., 2011; Önal, 2016; Ryang, 2014; Schmidt et al., 2009; Unfried et al., 2015; Viiri, 2003; Yusof et al., 2012) and interviews. The results of the varimax analyses shaped the factors in the STEMPCK Scale. The STEMPCK Scale consisted of six factors: 21st-Century Skills Knowledge, Pedagogical Knowledge, Mathematical Knowledge, Science Knowledge, Technology Knowledge, and Engineering Knowledge. The total variance of these six factors was 51.958%, and the Cronbach’s Alpha value of the scale was 0.95. The Cronbach’s Alpha value was calculated as 0.90 for 21st-Century Skills Knowledge, 0.87 for Pedagogical Knowledge, 0.85 for Mathematical Knowledge, 0.86 for Science Knowledge, 0.81 for Engineering Knowledge, and 0.78 for Technology Knowledge. These results show that the developed STEMPCK Scale is reliable.

Additionally, based on the confirmatory factor analysis results, the CFI, GFI, IFI, NFI, and AGFI values were higher than 0.90, indicating that model–data fit was high (Hooper et al., 2008; Sümer, 2000). In addition, the SRMR and RMSEA values (0.043 and 0.034, respectively) were
less than 0.05, indicating that model–data fit was high (Anderson & Gerbing, 1984; Hooper et al., 2008; Jöreskog & Sörbom, 1993; Sümer, 2000; Hu & Bentler, 1999). According to the confirmatory factor analysis results, model–data fit was high, and the STEMPCK Scale was found to have six subdimensions. This scale was found to be valid and reliable based on the results of the exploratory and confirmatory factor analyses.

The STEMPCK Scale was developed to assess preservice teachers’ STEMPCK. Understanding of teacher candidates’ STEMPCK will help teacher educators strengthen their courses and identify gaps in teacher candidates’ knowledge that need to be addressed.

Conclusion

The STEMPCK Scale is a valid and reliable instrument that will be used to measure STEMPCK for prospective teachers. A review of the literature found that there were no valid and reliable STEMPCK instruments for preservice and in-service teachers. Therefore, this study will contribute to this side of the STEMPCK literature. The validity and reliability of the instrument was determined using data from 655 students in Science Education, Mathematics Education, Elementary School Education, and Early Childhood Education. However, to use this instrument with different groups, the validity and reliability of the instrument would first need to be tested with those groups.

Some limitations were present in the study. This study was conducted with preservice teachers in the Mathematics Education, Science Education, Early Childhood Education, and Elementary School Education programs in the fall semester of 2017 in a public university in Turkey. Additional research is needed to administer the STEMPCK Scale in different groups or departments (e.g., the chemistry teaching department or the physics teaching department). Furthermore, during the pilot study, interviews were conducted with 40 students from the school of education and 17 students from the school of engineering. Because only one department (the computer science department) actively accepts students,1 only students from that department were invited to participate in this study, and the researchers conducted interviews with them. Researchers first started the study by reviewing and analyzing the literature about PCK. From various different conceptions given by the scholars, the researchers synthesized their own conception about the constructs to represent the scope of PCK needed by teachers in order to teach STEM subjects in the classrooms. Finally, this is the first study examining this instrument, and additional studies are needed to furnish more evidence of construct validity.

The STEMPCK Scale is a robust instrument that elementary, middle, and high school STEM education program leaders and teacher educators can use to identify what preservice and in-service teachers know in general and what they do not know. Because this instrument is new, researchers are also encouraged to continue testing and refining the scale’s content. Finally, this instrument could contribute to studies on teacher professional development and teacher education programs. Gaps in teachers’ knowledge that are identified can be used as guidelines for planning more effective professional development programs for teachers.

---

1 Due to an insufficient number of faculty members, our university has not completed the conditions required by the Council of Higher Education to accept student to other STEM departments.
